Subject: Marin County climate. A more digestible subset of my 90 page report
Date: Monday, December 26, 2022 3:39:37 PM

Ok, who reads 90 pages of anything except if it is Michael Lewis latest book.

A member of my elite small audience suggested I use Marin Post as a platform to communicate information in smaller, more digestible chunks.

So, I did just that.

This post is how Mt. Tam really "hydrates" us. Without Mt. Tam none of us could currently live in Southern Marin.

Subject: Review of a consulting assignment that did not go well and chatGPT implications
Date: Wednesday, December 28, 2022 12:40:30 PM

The local audience is very familiar with the situation. However, this case has broad relevance regarding the relationship between consultants and clients. Many of us have assumed the role of consultants in some situations, and clients in some others.

And, just like chatGPT will have a material impact on education at all levels. It will also have a material impact on the consulting business.

Subject: Marin Climate Part II
Date: Monday, January 2, 2023 10:16:14 AM

I had written a long section on climate within my 90 page water report. Few have read it. So, I decided to do two shorter blog posts on the topic.

My earlier post was focused on how Mount Tam is a true natural water manufacturing plant due to its orographic lift effect that raises the Pacific moist air, cools it down, and creates rain. You can read it below if you have missed it.

<https://marinpost.org/blog/2022/12/26/if-not-for-mt-tam-mmwd-could-not-support-a-single-water-customer>

Today's post is about long term historical and future prospective trends. And, the Westerlies winds and Mount Tam are two fortuitous forces of nature that are here to stay. With Climate Change our temperatures will rise a bit (or quite a bit depending on the emission scenario), and so will our rainfall (warmer Westerlies will carry more moisture). This assessment is based on the aggregation of NOAA models that you can check out at the following link.

https://crt-climate-explorer.nemac.org/climate_graphs/?city=Marin%2BCounty%2C+CA&county=Marin%2BCounty&area-id=06041&fips=06041&zoom=7&lat=38.083403&lon=-122.7633036&id=pcpn

Here is the related second post.

<https://marinpost.org/blog/2023/1/2/is-marin-destined-to-become-a-desert-nope>

I hope to condense both blogs into a Marin Voice article within the IJ in the near future. But, frankly conversing about data with just words, no numeric tables, no graphs... is almost like not conversing at all. On the other hand, the IJ has the reading audience... my Marin Post blog except for the few of you (or few among you) rdoes not. So, I am attempting to reach out through both channels.

Best,

Gaetan "Guy" Lion
